EDUCATION

University of Hull

Bachelor's in Robotics and Mechatronics (2:1)

Sep. 2019 – May 2022

EXPERIENCE

Lead Software Engineer

Sep. 2024 – Present

SECOM Plc

- Technical lead building a new business platform for both internal and customer use with Python, FastAPI, React, TypeScript, and Redis.
- Designed and built event-driven backend services that synchronise operational data across on-premises and third-party systems.
- Migrating legacy MySQL platforms onto a unified service-based architecture without downtime.
- Replacing manual workflows and document generation across the organisation.
- Own architecture, CI/CD, and operational reliability across all services on Google Cloud.

Systems Engineer

Jan. 2024 – Sep. 2024

British Steel

- Designed a molten steel tracking system to capture material used and wasted across the plant.
- Built data pipelines combining Digital Matter GPS telemetry, on-site sensor feeds, and legacy systems to support real-time logistics and production decisions.
- Interfaced with legacy Fortran and COBOL systems running critical production and financial reporting workflows.
- Built datasets used by operations for cost tracking, efficiency analysis, and production optimisation.

Software / Electronics Engineer

Jun. 2022 – Jan. 2024

Lampada

- Built a GPS-based campus navigation app for the University of Hull, with pathfinding around campus buildings and walkways.
- Designed and prototyped custom PCBs for client projects, from schematic capture through layout to manufacture.

Hydraulics Technician

May 2018 – Sep. 2019

Siemens Gamesa

- Built, calibrated, and serviced high-pressure hydraulic systems and devices used across the wind turbine industry.

Offshore Wind Turbine Technician

Sep. 2015 – May 2018

E.ON Energy

- Hands-on mechanical, electrical, and hydraulic maintenance of offshore wind turbines, with direct responsibility for turbine availability and generation uptime.
- Fault diagnosis and resolution using SCADA telemetry and on-site instrumentation across power generation, control, and safety systems.
- Worked under strict safety, working-at-height, and offshore-access certifications (GWO standards) in a remote, weather-constrained operational environment.

Software Engineer

Mar. 2024 – Jan. 2026

Gnome Trader (Personal Project)

- Reduced end-to-end delivery latency from approximately one hour of manual processing to sub-20-second automated execution.
- Designed and built a distributed Solana payment and delivery platform. Python, FastAPI, WebSockets, Redis, PostgreSQL, atomic Lua-scripted Redis claims with TTL self-healing.
- Verified on-chain Solana transactions before triggering downstream fulfilment, with idempotent payment processing and tolerance-window amount matching.
